

Hi all,

If you are following Hadley Wickham's "R Packages" book step-by-step, you might bump into these little problems due to the book being published in 2015 and things have slightly changed.

1. `devtools::use_data` has been moved to `usethis::use_data`.
(Same for many other `devtools::use_*` functions)

2. It'll be easier if you have all three of git, Rstudio project, R packages rooted on the same directory. Otherwise you'll encounter this error:

Error: ``use_data()`` is designed to work with packages.
Project '*' is not an R package.

if your R package directory is inside your Rstudio project directory. A workaround is to create another Rstudio project rooted on the R package directory to stop `usethis` from complaining. But perhaps it is better to avoid this folder structure + ugly workaround at all because you might encounter some other problems or annoyance later on, when, for example, using Travis CI.

3. By rooting everything on the same directory, I mean the `R/`, `man/` etc being in the same folder level as the `.gitignore` and `*.Rproj`.

Best regards,
Hao Chi Kiang
